Overview of the Practicum Engagement

Company Background

Figure 1. Kooapps Logo

Kooapps is an indie mobile gaming studio and publisher established in 2008, with its headquarters located at 12400 SE 38th Street, Bellevue, Washington. The company was founded by Chun-Kai “CK” Wang, Johnathan Chang, and Stephanie Cheng, three colleagues from Stanford University whose vision was shaped by the release of Apple’s Software Development Kit that same year. Their original concept was to develop an SAT flashcard application for the iPhone, a project that eventually grew into the studio now known as Kooapps. The name is derived from the phrase “Cool Apps” which reflects the founders’ intent to create games and apps that were entertaining and trendsetting.

In 2009, Solon Chen co-founded Kooapps Philippines Corporation, establishing the company's branch in Makati City. This office is responsible for game development, quality assurance, and creative production in support of the applications and games published under the Kooapps name. The company's guiding philosophy, "We make games we want to show our friends," reflects its vision of establishing a globally recognized Filipino gaming brand.

Mission

"To connect the world through amazing daily experiences."

Vision

“Build the first global Filipino gaming brand, one the entire country will be proud of.”

Nature of Assignments or Tasks Given

My position during my internship at Kooapps Philippines Corporation was Quality Assurance (QA) Intern. As a QA intern, I was tasked with testing applications, logging and documenting bugs identified during testing, and performing additional QA tasks such as verifying bug fixes and conducting research on trends within the game development industry. These tasks were aimed at ensuring that applications were free from bugs that could negatively impact the user experience while supporting the development team by providing accurate bug reports and contributing research that could help improve application development.

As the final requirement of my internship, I was tasked with completing a special project. My groupmates and I agreed on producing a feasibility study centered on Qase, a QA management platform built around the idea of housing everything, tools, testing stages, documentation, in one cloud-based system. Going into the research, I kept running into the same underlying issue: most QA workflows end up scattered across several disconnected tools, which slows things down and adds friction between stages. That became the angle I wanted to dig into, whether folding everything into a single platform could cut that friction and make the process more efficient. Out of the QA tools we considered, Qase ended up being the strongest candidate simply because its feature set covered more ground than the alternatives, which is what pushed our group to build the study around it.

Total Hours Rendered

The table below presents a summary of the different phases of my internship at Kooapps Philippines Corporation and the corresponding number of hours rendered for each phase.

Table 1. Summary of Hours Rendered

Training Phase	Training Description	Total Hours
A	Company Orientation	8
B	Quality Assurance Training	40
C	Quality Assurance Testing, Technical Documentation & Additional Related QA Tasks	238
D	Special Project Development	200
Total		486

Over the course of my internship, my hours were distributed among four phases. The first 8 hours were allotted to Company Orientation, which introduced me to the organization's policies, internal structure, and general expectations for interns. This was followed by 40 hours of Quality Assurance Training, during which I acquired the technical foundation I needed to test application builds accurately. The largest portion of my time, 238 hours was dedicated to hands-on QA activities which included application testing, technical documentation, bug verifications, and other related QA responsibilities. The final 200 hours were devoted to completing our special project,

which involved evaluating a QA tool and compiling the results into a feasibility study as our final internship requirement.

Presentation of Output

Due to the Non-Disclosure Agreement (NDA) governing my internship at Kooapps Philippines Corporation, internal documents, bug reports, test cases, screenshots, and other proprietary materials cannot be included in this report. The following discussion therefore provides a detailed but general account of the outputs and responsibilities I carried out during the internship without disclosing confidential company information.

Over the course of the internship, I was assigned recurring testing tasks that followed a consistent weekly cadence, including Scheduled Testing, Priority Testing, Ads Checking, and Weekly GPP Testing, in addition to Bug Fix Confirmation tasks whenever developers submitted resolutions to previously logged defects. Through this process, I tested multiple mobile applications across different platforms, logging defects related to gameplay mechanics, user interface behavior, advertisement integration, and other functional issues. Each defect was documented in a standardized format to help developers quickly understand, reproduce, and resolve the reported issue.

Beyond the usual testing, I also contributed to my team's special project by researching and evaluating third-party QA tools and workflow solutions. This research supported the feasibility study on Qase, which examined how consolidating multiple QA tools into a single, centralized, cloud-based platform could reduce context switching and streamline our overall testing and documentation process. The study involved comparing our existing tools against the features offered by Qase and assessing the practicality of transitioning to the new platform.

Software Used

The company relies on a third-party communication platform for coordinating daily work assignments, sharing announcements, and communicating updates across teams. This platform served as my main channel for identifying the day's testing tasks, tracking updates on previously reported bugs, and staying informed of changes within the company.

A third-party task management tool is likewise used for creating tickets that specify which application is to be tested, the platform and version involved, and the relevant changelogs for the newest update. This tool also links to the spreadsheets where I logged and documented testing findings and bug reports.

The company additionally uses a third-party QA support tool that provides testing-related information relevant to the application under evaluation, helping ensure that application behavior aligns with the expected functionality described in each assigned task. For my special project, my teammates and I specifically evaluated Qase, a cloud-based QA test management platform, as a potential tool for consolidating our testing, documentation, and communication workflow into a single system.

Hardware Used

Testing was carried out across a range of devices, including smartphones, tablets, and laptops, allowing me to check how applications performed and displayed across different screen sizes and device types. Having access to multiple devices was essential for catching issues that might only appear on certain hardware, ensuring that builds were tested under conditions similar to what actual users would experience.

Screen of the Features

Since screenshots and other visual materials cannot be included due to the NDA, this section instead describes, in general terms, the types of screens and features I regularly tested throughout my internship. A significant part of my testing involved main gameplay screens, where I checked the core gameplay loop, control responsiveness, and scoring or level-progression systems to confirm everything functioned as expected after each build update. I also tested menu and navigation screens, including home screens, settings menus, and level-select interfaces, making sure buttons, transitions, and layouts rendered correctly and consistently across different devices. In addition, I regularly checked advertisement placements within the applications to

confirm that ads displayed at the correct points in the user experience and dismissed properly without disrupting gameplay.

Synthesis of the Practicum Engagement

Learnings

My internship at Kooapps Philippines Corporation gave me insight into the practice of Quality Assurance. Over the course of the internship, I developed the ability to test mobile applications systematically, following structured processes for scheduled testing and priority testing, while documenting findings in a clear and organized manner. I also learned firsthand how something as small as a mistimed advertisement or an inconsistent UI element can quietly undermine an application's overall quality.

Confirming bug fixes repeatedly also drilled in the importance of thoroughness, retesting each bug under its original conditions was the only reliable way to confirm that a fix worked. Alongside that, my groupmates and I relied heavily on clear, timely communication throughout both routine testing and the Qase feasibility study, an experience that noticeably sharpened my communication skills.

Realization

The practicum made it clear for me that every professional role comes with its own demands, no matter how straightforward it looks on paper. Identifying bugs might be the most visible part of QA work, but doing it well actually comes down to persistence and a keen eye, along with solid communication, staying on top of every assignment, update, and ongoing project mattered just as much as the testing itself.

One realization that stuck with me had to do with workplace communication, and it came from a mistake on my own end. At one point, I let a colleague submit a request to our supervisor on my behalf instead of raising it myself. My supervisor handled it professionally but made it clear that every worker and intern is expected to raise their own requests directly, not through someone

else. It was a fair callout, and it taught me to take ownership of my own concerns instead of letting someone else carry them for me, especially in a workplace setting where that kind of thing reads as unprofessional.

On a more personal note, the internship also showed me how much commitment a job demands. The commute to the office alone took a while and was honestly exhausting, so I had to get up early and plan my whole morning around making it on time. It wasn't always easy, but it pushed me to be more disciplined and punctual than I probably would've been otherwise.

Conclusion

Overall, my internship at Kooapps Philippines Corporation turned out to be a genuinely good experience, not just for the technical side of things, but personally too. I got to build real rapport with some of the other interns, and having people around who made the day-to-day less monotonous made a real difference. Beyond the QA skills I picked up, the internship gave me a clearer sense of what it takes to be a solid IT professional, which is staying attentive, adapting when things don't go as planned, and communicating well with the people around you. Looking back, this practicum did more than prepare me for a QA role specifically, it gave me a real feel for what working in a professional environment is actually like, on top of the technical exposure I came in hoping to get.
